HANDBOOK ON MINIMUM INFORMATION INTEROPERABILITY STANDARDS (MIOS)

BLUEPRINT TO GUIDE SEAMLESSNESS AND INTEROPERABILITY IN PUBLIC SERVICE AS PRESENTED BY THE DEPARTMENT OF PUBLIC SERVICE
Foreword

Information systems have the potential to transform Government and the services it provides to the public. But without consistent policies and standards to underpin those systems it will not be possible to work together to deliver collaborative services.

This policy discussion document suggests the technical standards and policies that will act as the foundation of our e-Government strategy. These standards will allow information to flow seamlessly across the public sector and will provide citizens and businesses with better access to government services. In addition, by adopting Internet and World Wide Web standards, the Framework aligns government with the rest of industry and serves as a basis for reducing the costs and risks associated with carrying out major IT projects.

We are aware that the electronic world is changing rapidly but thanks to foresight, continuous research and development that informs our Internet based change management process, we intend not only to keep pace with this change, but where necessary, to lead in the adoption of innovative market leading solutions. This is also why we will be publishing a series of handbooks, CD Roms, newsletters and online discussion forums in order to keep abreast with the very latest public sector standards and comment on these, and also provide us with innovative proposals for solving some of our generic IT problems.

Next to security and the availing of information infrastructure, the Interoperability Framework, as a cornerstone of the e-government strategy, will enable us to address the challenges of today’s diverse systems and position ourselves for new opportunities in the future.

This document reflects our promise to stay ahead in the fast moving world of e-business, by reflecting new technologies and market developments. We intend to continue to update the framework, following continuous consultation, and to make it, and supplementary advice and guidance, available on the www.dpsa.gov.za website
Executive Summary

Better public services tailored to the needs of the citizen and business, as envisioned in the e-government policy framework discussion document, require the seamless flow of information across all the tiers of government i.e. National, Provincial and Local. The Minimum Information Interoperability Standards (MIOS) sets out the Government’s technical policies and standards for achieving interoperability and information systems coherence across the public sector. The MIOS defines the essential pre-requisite for joined-up and web enabled government. Next to security, it is a cornerstone policy in the overall e-government strategy.

Adherence to the MIOS standards and policies is mandatory as also set in the proposed chapter five of the Public Service Regulations. They set the underlying infrastructure, freeing up public sector organisations so that they can concentrate on serving the customer through building value added information and services. It will be for the government departments themselves to consider how their business processes can be changed to be more effective by taking advantage of the opportunities provided by increased interoperability. The State Information Technology Agency is setup to assist in these processes, thereby granting respective organs of state to streamline and focus of their areas of mandate and competency.

The main thrust of the framework (in line with international best practice), is to adopt the Internet and World Wide Web standards for all government systems. There is a strategic decision to adopt Extensible Markup Language (XML) and Extensible Stylesheet Language (XSL) as the core standard for Data interoperability and management of presentational data. This includes the definition and central provision of XML schemas for use throughout the public sector. The MIOS also adopts standards that are well supported in the global market place. It is a pragmatic strategy that aims to reduce cost and risk for government systems whilst aligning them to the global information society revolution.

Specifying policies and standards in themselves is not enough. Successful implementation will mean the provision of support, best practice guidance, toolkits and centrally agreed data schemas. To provide this, the DPSA will be launching a series of publications through the Office of the Government Chief Information Officer (OGCIO). This is a Cabinet approved Office dedicated to deal with the whole issue of technology for improved governance, which entlists the generation of agreements pertaining to XML data schemas for use throughout the public sector. the OGCIO is also now being used for wide consultation on a number of other e-Government frameworks and processes.

The aims of the MIOS will not be achieved overnight. The strategy needs to be managed as a long-term ongoing initiative and must therefore be supported by robust processes. These processes, including the roles and responsibilities of key stakeholders, committees, management and
working groups, are outlined in the document. Of particular significance is the establishment of a Government Information Technology Officers Council, (GITOC) which consists of representatives from all Government departments including provincial and local Government. Other stakeholders include, the Department of Communications (DoC), Department of Arts Culture Science and Technology (DACST), Department of Public Enterprises (DPE), National Intelligence Agency (NIA) etc.

It is also essential to ensure that the MIOS remains up to date and aligned to the requirements of all stakeholders and able to embrace the potential of new technology and market developments. In this instance, cooperation and collaboration becomes a critical success factor for the formulation of strategic synergies. The MIOS introduces an Internet based change management process which has been designed to engage and serve the stakeholder community in a dynamic way and to bring in innovations from industry on a global basis.

Table 1: Document History

1 Overview

1.1 Introduction

1.1.1 Modernising government and joined-up government demand joined-up information systems. Interoperable systems working in a seamless and coherent way across the public sector hold the key to providing better services tailored to the needs of the citizen and business and at a lower cost.

1.1.2 At the same time, clearly defined policies and standards for interoperability and information are also key to staying connected to the outside world and aligned to the global information revolution. This revolution is fuelled by the explosive growth of the Internet and its technologies.

1.1.3 The Minimum Information Interoperability Standards (MIOS) sets out the Government's policies and standards for achieving interoperability and seamless information flow across government as well as the wider public sector. The Minimum Interoperability Standards are fundamental in supporting the e-Government Policy published in April 2001.

1.1.4 The implementation and management process are defined in the MIOS Implementation Support document. This can be obtained from (....)

1.2 Forecast Changes for Future Versions

1.2.1 Aspects currently under consideration for future versions include:

- IPv6.
- Standards for Video Conferencing and IP Telephony
- Standards for Voice over IP
- Standards for chat and instant messaging
- Standards for Biometrics and Smart Cards
- Detail of the compliance processes
- Further detail on the implementation strategy
- Identification and linkage to public sector communities’ frameworks
- Incorporation of ebXML standards
- Standards for content delivery to:
- Support the indigenous languages
- Support the disabled

1.3 Scope

1.3.1 The scope of the MIOS comprises the exchange of data and information access between RSA Government systems covering the interactions between:
1.3.2 “RSA Government” includes National and Provincial Government departments and their agencies, Local Government and the wider public sector, e.g. organs of state, state-owned enterprises etc.

1.3.3 The MIOS standards are mandated on all new systems that fall within the scope defined in paragraph 1.5 above. In order to address some of the interoperability challenges identified by e-Government Policy, all other systems (which deliver citizen and/or business centric services and are part of departmental electronic service delivery) and legacy systems will need to comply with these standards.

1.3.4 For systems that fall outside the scope and mandate, the MIOS is recommended in all public sector procurements and major upgrades to other departmental legacy systems. Guidance on complying with this mandate is given in the MIOS Implementation Support document.

1.3.5 The MIOS does not standardise the appearance of information on the human interface which can be provided by various user channels e.g. web browsing, public kiosks, Digital TV and WAP phones. The MIOS does standardise the interchange requirements for the delivery of data to interfaces and tools for the management of the presentation of data.

1.4 **Main Features**

1.4.1 The MIOS comprises three major components: policies and standards, a strategy for XML schemas provision. Policies and standards are outlined below. The management processes and the strategy for XML schema provision are defined in the MIOS Implementation Support document. The logical separation of the components was done to ensure manageable maintenance of components. This would ensure that update or modifications in one component does not necessarily affect the other component e.g. if the management structure changes, this would not necessarily affect the standards. Although MIOS implementation is not covered here, an overall picture is provided to ensure continuity between the components.

**Policies and standards**

1.4.2 The technical policies and standards for interoperability across the public sector are specified in Section 2 of this document. These are the minimum set necessary to support the range of transactions and services provided by government and to integrate information systems within government. These policies and standards have also been chosen to
interconnect and align government to the Internet and its future development.

1.4.3 The policies and standards in the MIOS cover three key areas of technical policy, which are essential for interoperability. These are Interconnectivity, Data Interoperability and Information Access.

1.4.4 In all of these areas, the main thrust of the specification has been to adopt the Internet and World Wide Web standards for all government systems. There is also a strategic decision to adopt XML as the main standard for data integration. This strategy includes provision of XML schemas for use throughout the public sector based on a set of agreed data standards, e.g. BS 7666 for property addresses.

Implementation support

1.4.5 The adoption of XML (Extensible Mark-up Language) and XSL (Extensible Stylesheet Language) form the cornerstone of the government data presentation and integration strategy. However adopting these standards, in themselves, is not sufficient.

1.4.6 Achieving data coherence across government means that government organisations need data schemas that have been agreed for use throughout the public sector. They also need information, best practice guidance and toolkits to make implementation easier. In order to meet these demands, the RSA Government has embarked on an initiative to propose mechanisms and standards for achieving interoperability based on best practice and lessons learned from other countries. This initiative, managed by SITA e-Services, will publish on the Internet the draft and agreed XML data schemas which can then be applied to any public sector system. The group will also make available on the RSA MIOS web site the best of breed toolkits, guidance and information on XML implementation.

Management Processes

1.4.7 The work of integrating and evolving information systems across the public sector is a complex on-going process. The MIOS approach and policies must not only support and enhance government’s business processes but also ensure that it stays tuned to the possibilities of new technological advances and innovations.

1.4.8 The MIOS management processes are described in MIOS Implementation Support. These cover:

- a governance process that describes the roles and responsibilities, committee structures and compliance processes
- an Internet based change management process that is designed to introduce a global consultation and change process for capturing
maximum stakeholder involvement and innovation.

1.5 Relationships with other initiatives

Security Framework

1.5.1 ISO 17799 (formerly BS 7799) is being proposed across National and Provincial Government departments and is recommended across the wider public sector as a framework for Information Security Management. For more information on Security policies, see www.dpsa.gov.za, click on e-Government

Electronic service delivery

1.5.2 The DPSA is in the process of reformulating the e-Government Policy and Strategy from a citizen’s point of view. Following the publication of its e-Commerce strategy in the “Towards an e-Government” and “the e-Government Policy” accessible at www.dpsa.gov.za, the Government is now looking at strategic options and priorities for services to the citizen and how government should be organised to deliver these services. These citizen focused services, once defined and agreed upon, will act as major drivers for the types of data schemas that will need to be agreed upon and delivered by SITA e-Services.

Portals

1.5.3 The RSA Government is considering the portal approach to provide an easy to use, trusted and personalised service, allowing the citizen to deal with government on a one-to-one basis, whilst presenting government as an integrated organisation. It aims to be the citizen’s ‘personal window’ on government and the preferred method for the public to engage with the public sector.

1.5.4 The MIOS standards are applicable to all future portal developments in government and also give the standards specification for private sector portals wishing to link up to the government portal.

Metadata Framework

1.5.5 The e-Government Metadata Framework (e-GMF) needs to be defined to set the Government's policies for establishing and implementing metadata standards across the public sector. Where the MIOS lays down the technical standards for information connectivity, the e-GMF is concerned with the particular facets of metadata intended to support resource discovery and records management.
**Metadata Standard**

1.5.6  The e-Government Metadata Standard (e-GMS) will cover the core set of 'elements' that contain data needed for the effective retrieval and management of official information. The e-Government Metadata Framework (e-GMF) outlines the policy that will lead to the e-Government Metadata Standard (e-GMS) being used across all of Government's information systems. The main thrust of the e-GMF is to provide a set of metadata elements suitable for the needs of the Government, and to develop a Pan-Government Thesaurus.

**Government Information Technology Architecture (GITA) Framework**

1.5.7  The MIOS is an integral part of the GITA. MIOS resides within the governance layer of the GITA framework. The governance layer includes best practices, policies and standards. Interoperability standards are a special component of standards meant to define connectivity, integration and interface between systems and users.

**1.6 Your involvement**

1.6.1  Continual engagement of all our stakeholders in the development and implementation of the MIOS is a fundamental policy objective. Government departments and their agencies, organs of state, local government, industry and the citizen are all encouraged to comment and suggest ways of improving the strategy, and providing support and implementation of the MIOS. Our preferred way will be through the Internet on the dedicated RSA MIOS web site.
2 Policies and Technical Standards

2.1 Introduction

2.1.1 This section of the MIOS defines the minimum\(^1\) set of technical policies and standards necessary to achieve interoperability and seamless information flows across Government and the public sector.

2.1.2 The current specification for the MIOS is given below and covers the areas of interconnectivity, Data Interoperability and Information Access. Each area is presented in two parts, first the key policy decisions and then a table containing the specified standard including version numbers and notes. Government is, however, committed to ensuring that these policies and standards are kept aligned to the changing requirements of the public sector and to the evolution of the market and technology.

2.2 Key decisions and drivers

2.2.1 At the highest level, the MIOS has been shaped by three key policy decisions; these are:

- alignment with the Internet – the universal adoption of common standards used on the Internet and World Wide Web for all public sector information systems,
- adoption of XML – as the primary standard for Data Interoperability and presentation tools for all public sector systems and
- W3C compliant browser as the key interface – all public sector information systems to be accessible through browser based technology. Other interfaces are permitted but only in addition to browser based ones.

The selection of MIOS standards has been driven by:

- Interoperability – only standards that are relevant to Systems Interconnectivity, Data Interoperability and Information Access are specified
- Market support – the standards selected are widely supported by the market, and are likely to reduce the cost and risk of government information systems
- Scalability – standards selected have the capacity to be scaled to satisfy changed demands made on the system, such as changes in data volumes, number of transactions or number of users.
- Open Standards – the specifications for the standards are documented and available to the public at large.

\(^{1}\)
2.3 Open Standards

2.3.1 There are number of definitions of open standards which emphasise different aspects of openness, including of the resulting specification, the openness of the drafting process, and the ownership of rights in the standard. The list below contains frequently cited indicators of the openness of a standard. For the purposes of the MIOS, a standard shall be considered open if it meets all of these criteria. There are standards which we are obliged to adopt for pragmatic reasons which do not necessarily fully conform to being open in all respects. In such cases, where an open standard does not yet exist, the degree of openness will be taken into account when selecting an appropriate standard:

- it should be maintained by a non-commercial organization
- participation in the ongoing development work is based on decision-making processes that are open to all interested parties.
- open access: all may access committee documents, drafts and completed standards free of cost or for a negligible fee.
- It must be possible for everyone to copy, distribute and use the standard free of cost.
- The intellectual rights required to implement the standard (e.g. essential patent claims) are irrevocably available, without any royalties attached.
- There are no reservations regarding reuse of the standard.
- There are multiple implementations of the standard

2.4 Standards Development Organisations

2.4.1 There are a number of standards development organisations (SDOs) referred to in this document. The following table provides a brief reference – SDOs marked with an asterisk (*) indicate that standards are freely downloadable:
2.5 Interconnection policies

The policies for systems interconnection are defined below:

**Policy for Networks**

2.5.1 Departments are to interconnect using IPv4, noting that RSA Government is considering the adoption of IPv6 in due course. Peering agreements should investigated and considered where possible.

**Policy for Security**

2.5.2 Protectively marked data will be handled and transmitted in accordance with the provisions of the ISO 17799

2.5.3 Non-protectively marked data will be handled and transmitted in accordance with the Public Service Information Security Framework

**Policy for e-Mail.**

2.5.4 To use a product that supports interfaces which conform to the SMTP/MIME.
2.5.5 Within government, the norm will be to use the intrinsic security to ensure e-mail confidentiality. Outside secure government networks, S/MIME V3 should be used for secure messaging.

Policy for Directory

2.5.6 A Directory schema should be developed to support a range of communication services including message handling, telephone and facsimile services as well as interactive access to a range of other applications.

Policy for Domain Naming

2.5.7 Projects are to follow the RSA Government Domain Naming policy.

2.5.8 Domain Name Services (DNS) is to be used for Internet/intranet domain name to IP address resolution.

Policy for File Transfer Protocol (FTP)

2.5.9 FTP should be used where file transfer is necessary within Government Intranets. Restart and recovery facilities of FTP are to be used when transferring very large files.

Policy for Terminal Emulation

2.5.10 Web based technology is to be used in applications that previously used Terminal Emulation whenever possible.

Interconnection Standards and Specifications

2.5.11 The RSA Government standards and specifications for interconnectivity are:

<table>
<thead>
<tr>
<th>Component</th>
<th>Standard</th>
<th>Standards Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hypertext transfer</td>
<td>HTTP v1.1 (RFC 2616) Hypertext standards include on-line wide-area</td>
<td>IETF/W3C</td>
</tr>
<tr>
<td>protocols</td>
<td>standards include on-line wide-area publishing services.</td>
<td></td>
</tr>
<tr>
<td>Email transport</td>
<td>ESMTP (RFC2821, RFC2822)</td>
<td>IETF</td>
</tr>
<tr>
<td>Internet message format</td>
<td>MIME (RFC 2045, RFC 2046, RFC 2047, RFC 2048 and RFC 2077)</td>
<td>IETF</td>
</tr>
</tbody>
</table>
### 2.6 Data Interoperability

#### Data Interoperability Policies

2.6.1 RSA Government Policy is to use:

- XML and XML Schema for Data Interoperability
- RDF for Metadata framework. It provides interoperability between applications that exchange machine-understandable information on the Web.
- UML v1.3 (Notation, Meta-model and Extensible Metadata Interchange XMI Data Type Definition DTD ), for all business and system/application modeling.
- XSL for data transformation.
2.6.2 XML products will be written so as to comply with the recommendations of the World Wide Web Consortium (W3C). Where necessary the government will base the work on the draft W3C standards but will avoid the use of any product specific XML extensions that are not being considered for open standardisation within the W3C.

**Data Interoperability standards and specifications**

The RSA Government standards and specifications for Data Interoperability and transformation are:

<table>
<thead>
<tr>
<th>Component</th>
<th>Standard</th>
<th>Standard Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>Metadata/MetaLanguage</td>
<td>XML (Extensible Markup Language)</td>
<td>W3C</td>

</tr>
<tr>
<td>Form Representation and Data</td>
<td>RDF (Resource Description Framework)</td>
<td>W3C</td>
</tr>
<tr>
<td>Geospatial data</td>
<td>GML (Geospatial Markup Language)</td>
<td>Open Geographic Council.</td>
</tr>
</tbody>
</table>

Table 4: Standards and specifications for data integration

2.6.3 It may be necessary to interface to legacy systems which do not have native XML support by using appropriate middleware as illustrated below. Although the configurations below present potential solutions, it should be clear that new procurements should strive to use the direct XML model as shown.
2.7 Information Access Policies

Policies for Information Access are:

2.7.1 The Government Policies for information access are

- government information systems will be designed so that as much information as possible can be accessed and manipulated from common commercial browsers through utilisation of functionality freely supported and available within the browser community.
- government information systems will be designed to be available, as appropriate, on the Internet, either directly, or via third party services.
- government information systems will support the standards and specifications listed in the browser standards and specifications tables below using, where necessary, freely available browser plug-
government information systems will be designed to provide protection against security risks of connection to the Internet, including the ability to protect against the vulnerability of downloading executable content code that is not authenticated

- additional middleware or plug-ins are to be used, when necessary, to enhance browser functionality
- browser standards adopted for conformance should support those features that a business or citizen may be assumed to have available or can easily download without incurring a licensing fee, not withstanding the policy requirement that all public sector information systems be accessible through browser based technology, other interfaces are permitted in addition to browser based ones
- government information access systems will be designed to provide the ability to support the citizen in their own time and at their own pace i.e. for asynchronous operation as well as synchronous

**Standards and Specifications for Information Access**

2.7.2 The Government standards and specifications for information access, browsers and viewers are defined in tables 3 and 4 below. The services to be delivered to the citizen will dictate the expected standards required to be supported by the browser. However, as some browsers may only support the basic standards listed in table 3, this results in only a limited set of e-Government services being able to be offered via such browsers.

2.7.3 As such, the essential minimal level of information required to be accessed and viewed by the citizen should either be conveyed or be capable of being converted using personalization technologies, e.g. transcoders, through the use of the basic standards in Table 3.

<table>
<thead>
<tr>
<th>Component</th>
<th>Standard</th>
<th>Standard Body</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hypertext interchange formats</td>
<td>Those parts of HTML v4.0 and XHTML commonly implemented by Firefox v2.0 or later, and MS Internet Explorer v6 or later, plus their interoperable extensions</td>
<td>W3C</td>
</tr>
<tr>
<td>Working Office Document formats (word-processing, spreadsheet, presentation)</td>
<td>UTF-8/ASCII Formatted Text OpenDocument v1.0 (ISO26300) and later Oasis versions</td>
<td>IETF OASIS/ISO</td>
</tr>
<tr>
<td>Document formats for presentation view</td>
<td>XHTML markup PDF (version 1.6)</td>
<td>W3C Adobe²</td>
</tr>
</tbody>
</table>

² The full specification for pdf version 1.7 is available at [http://www.adobe.com/devnet/pdf/pdf_reference.html](http://www.adobe.com/devnet/pdf/pdf_reference.html), but is unreadable by the current linux acrobat reader. There are other issues with pdf which lead us to accept the format pragmatically but reluctantly whilst we monitor new emerging XML specifications (including Adobe's upcoming MARS and Microsoft's XPS).
<table>
<thead>
<tr>
<th>Component</th>
<th>Standard</th>
<th>Standard Body</th>
</tr>
</thead>
<tbody>

</tr>
</tbody>
</table>

Table 6: Additional standards and specifications for information access

**Content Delivery**

2.7.5 The design aim is for the content to be independent of the delivery mechanism, hence the strategic direction is to use XML and XSL (see table 2).

2.7.6 The full range of services to be delivered to the citizen will dictate the standards required. Content management techniques and personalisation technologies can be used to support various delivery channels e.g. low function web browsers, public kiosks, Digital TV, WAP phones, etc.

2.7.7 Transcoding services, as an example of personalisation
technologies, can deliver web content to a variety of destination environments within greatly reduced timescales and at significantly reduced cost. The principle is that transcoding can be used to dynamically filter, convert and reformat web content to match the requirements and display capabilities of the destination device. Transcoding technology is server-side software that modifies Web page content based on data protocols, markup languages, device and network parameters and user preferences.

2.7.8 Personalisation technologies may also be used to support groups such as ethnic minorities or visually impaired or blind people (i.e. by using text translation, larger fonts and graphics, audio, etc. via a transcoder).

WAP access standards and specifications

2.7.9 The services to be delivered to the citizen via mobile phones will conform to the WAP Specification Suite, published by the WAP Forum as implemented to interoperable standards by the WAP providers.

2.7.10 The issues of security, relating to transactions undertaken through mobile phones, are complex and depend on emerging industry standards. Work in this area will be undertaken in due course. In the meantime the lack of standards does not imply that security issues can be ignored. Decisions will need to be made on a case by case basis depending on the nature of the transaction in question.
